## Aerotriangulation Report Scott County, IA 2009

This report summarizes the aerotriangulation (AT) results of 0.4' GSD (Ground Sample Distance) color digital aerial photography captured for the Scott County, IA. The photography was acquired using a Leica ADS40 digital camera, sensor head 30104. Mission dates were April 8<sup>th</sup>, 9<sup>th</sup>, 11<sup>th</sup>, and 15<sup>th</sup> 2009. The photography consisted of 57 flight lines and covered Scott County its entirety.

The AT referenced the NAD83(96) State Plane Coordinate System, Iowa South Zone (1402). The vertical reference datum used was NAVD88(Geoid03). The measurement units used were US survey feet.

The AT project was set up as four separate sub-blocks. The sub-blocks were controlled with a combination of airborne GPS/INS data and ground-based control points. The airborne GPS data was post-processed using TerraTecAS TerraPos v1.3.2 and Applanix POSGNSS v4.4. Inertial navigation system (INS) data was coupled with the processed GPS data using Leica IPAS Pro v1.33. APM (Automated Point Matching) measurements were generated to tie image strips and bands within strips together relatively using Leica GPro v3.3.1. Upon completion of APM, AT processing was performed using Leica ORIMA/CAP-A v9.1. Controls are measured and bundle adjustments are run using the controls to define the datum. Throughout an adjustment's iterations, statistical measures are used to detect and remove blunders in the APM and to refine the image coordinate measurements, ending with a final adjustment to the block of photography. After each adjustment, the resulting block statistics are thoroughly analyzed. These statistics provide a check on the quality of automatic and manual point measurements, ground controls, GPS/INS data, and the resulting exterior orientation parameters. This process ultimately produces a refined, final adjustment for the block of photography meeting all standards for photography at the scale it was flown.

There were 64 control points supplied for the project. All controls were measurable and used in the AT.

The achieved results for each component of the AT are included in the table below. These values are taken or computed from the block printouts. Sigma0 is a measure of the overall adjustment. GPS and IMU RMS reflect the remaining random errors in those components. Tie point RMS values reflect the average accuracy which was achieved at all terrain points. Control point RMS values reflect an average movement of the controls and is computed from the residuals of all control points. Control points define the datum for the blocks and, because

of their importance, a more informative table containing all control points in US survey feet is also included.

The block printouts for each AT block are not included within this report. Their length and formatting do not lend themselves to proper viewing here. However, they are included along with this report and are best viewed in WordPad or NotePad with the wordwrap feature turned off.
